The short answer: for most sites, **embed** the video from a proper video service (such as YouTube or Vimeo) instead of storing it on the hosting. A video is heavy, spends traffic on every view and, on phones with a weak connection, does not play. The video service handles the weight and adjusts the quality to each visitor.

The two routes

Route	When it fits
Embed from a video service	Almost always. It copes with many views and adapts quality to the viewer's connection.
Store the file on the hosting	Only for very short videos, like an animated background of a few seconds, and light.
Many long videos, for many people	Not for an ordinary hosting: Online radio or video.
Privacy	An embedded video can set the service's cookies. Look for the enhanced privacy mode, if the service has one, and the cookie notice.
Captions	They help people who watch without sound, which is a lot, and those who do not hear well.

Step by step

1

Publish the video on the video service and copy the “embed” code or, in WordPress, just the link, on a line by itself.

2

Paste it into the page where you want it. In WordPress, the editor shows the video by itself: **Creating and editing pages in WordPress**.

3

Defer the loading: an embedded video loads a lot of code even before it is seen. Use lazy loading or an image that only loads the video on click: **Lazy loading**.

4

Do not autoplay with sound. If you want movement, use a short, silent, looping, light video.

5

Test on a phone, on mobile data: **A light site on mobile data**.

A video at the top of the page may be what makes it slow. Measure with and without it: **What makes a difference when the site is slow**. For a video background, prefer a still image on phones.

For the cookies an embedded video brings, see **The cookie notice**. For the video's cover image, **optimise it**.

Did your site get slow after adding videos? Open a ticket with the page's address.
