What the MCP server costs, and testing it in the Sandbox

MCP Server Created on **November 28, 2026** 3 min read

The MCP server has no price of its own. You pay for what the tools use of the AI API, at the same prices, with AI credits or, in chat, with Coding Plan points. With a `sandbox_` key, you can test everything without spending anything.

What each tool costs

Tool	Cost
`list_models`, `get_model`, `get_generation`, `get_balance`	Nothing.
`generate_image`, `generate_video`, `generate_audio`	Credits, at the model price in `list_models`: per image, per second of video or per generation.
`chat`	The tokens, at the model price. With a Coding Plan, the plan models spend points instead of credits.
`web_search`	0.5 credits per search. A search that fails costs nothing.

How a generation is charged

We reserve the credits on the request, charge the real cost at the end and return the rest. A generation that fails costs nothing. If your credits do not cover the reservation, the tool returns an error and nothing is charged. The generation keeps running on the server even if the agent stops waiting, and it is charged when it finishes.

Check before you spend

Before a long video or many images, ask the agent for the price and the balance, for example: "How much does each second of video cost and how many credits do I have left?". Each tool call shows up in the history of **All in One AI** and counts towards the requests per minute limit of the key. With your account, through OAuth, the limit counts for the whole account.

Testing in the Sandbox

With a `sandbox_` key in the header, the server answers in the same format, but calls no model and charges nothing. `chat` always answers "Resposta de teste (sandbox).". A generation is ready at once, with a sample link and `0` credits. The model list, the prices and the balance are the real ones.

With your account, through OAuth, requests are always production. To test at no cost, you do need a key. In Claude Code:

1. Create a `sandbox_` key with `ai:read` and `ai:write` in the **API Center**, and put it in the `INTERWEB_API_KEY` variable.
2. Add the server with the command below.
3. In Claude Code, ask "Generate a test image". You should get a sample link and `0` credits.
4. To work, switch to the `prod_` key, as explained next.

```
claude mcp add --transport http --scope user interweb-ai https://api.interweb.ao/mcp \
--header "Authorization: Bearer $INTERWEB_API_KEY"
```

In Claude Code, changing the variable is not enough.
The terminal replaces the variable with the key before running the command, and the key is saved in `~/.claude.json`. To move to the `prod_` key, run `claude mcp remove interweb-ai` and add the server again. In Codex and Cursor, the variable is read when the tool opens: change it and open the tool again.

More about the test answers in **testing All in One AI in the Sandbox**.

RECOMMENDED

Want to know the price of each model? See the Coding with AI page and the Models tab.
