Kilo Code and the Coding Plan: points, credits and what is left

Kilo Code Created on **November 28, 2026** 3 min read

Kilo Code works the same with AI credits or with a Coding Plan, in the extension and on the command line. The key and the setup do not change. What changes is how each request is paid: with the plan, the plan's models spend points and the others spend credits.

How requests are paid

1. A request to a model in the plan spends points instead of credits: the input, output and cache tokens, each multiplied by that model's value. Stronger models spend more points per token.

2. A request to a model that is not in the plan is paid with credits, at the price in `GET /v1/models`.

3. The plan's models are listed in the **Plan tab** of All in One AI. The models recommended in our documentation, such as `moonshotai/kimi-k2.7-code` and `zai-org/glm-5.2`, are part of the plan.

When the points come back

The weekly points come back every Monday at 00:00 UTC and do not carry over to the next week. The monthly points count from the start of the subscription period and come back at each renewal. Whichever limit runs out first counts, the weekly or the monthly one. The points of each plan are in the article **Coding Plan: which plan to choose**.

When the points run out in the middle of your work

By default, Kilo Code keeps working and requests are paid with the credits in your balance, at the normal price, until the points come back. You can turn this off in the Plan tab, in Use credits when the plan runs out.

When it is off, or without credits, the API answers `429` with `plan_limit_reached` until the reset. The error has `details.limit` (`weekly` or `monthly`), `details.resets_at` and the `Retry-After` header, with the seconds left.

Checking what is left

The Plan tab shows the points. Through the API, use the same key:

On Linux and macOS:

```
curl "https://api.interweb.ao/v1/ai/balance" -H "Authorization: Bearer $INTERWEB_API_KEY"
```

In Windows PowerShell:

```
curl.exe "https://api.interweb.ao/v1/ai/balance" -H "Authorization: Bearer $env:INTERWEB_API_KEY"
```

With a plan, the answer has `subscription`: `weekly_remaining` and `monthly_remaining` are the points left, `weekly_resets_at` and `monthly_resets_at` say when they come back, and `fallback_to_credits` says whether it carries on with credits when they run out. `credits` is your credit balance. In the terminal, `aio balance` shows the same: see **the aio command**.

Credits, even with the plan

Even with the plan, keep some credits. They pay for the models outside the plan and, with the option on, the requests after the points run out. For those requests, `limit.output` counts: Kilo Code sends it as `max_tokens` and we reserve credits for it. Without it, Kilo Code asks for 32,000 tokens. See **context and output limits in kilo.jsonc**.
