The 429 plan_limit_reached error: details.limit, resets_at and Retry-After

Coding Plan Created on **November 28, 2026** 2 min read

The `429 plan_limit_reached` error means the Coding Plan points ran out and the request cannot be paid with credits. It only happens when "Use credits when the plan runs out" is off, or when the account has no credits left.

What the error looks like

```
{
  "error": {
    "code": "plan_limit_reached",
    "message": "Your plan's weekly limit has been reached.",
    "correlation_id": "0f8fad5b-d9cb-469f-a165-70867728950e",
    "details": {
      "limit": "weekly",
      "used": 16500000,
      "remaining": 0,
      "resets_at": "2026-11-23T00:00:00+00:00",
      "fallback_to_credits": false,
      "credits": 0
    }
  }
}
```

It comes with the `Retry-After` header, with the seconds left until the reset.

What each field says

Field	What it says
`details.limit`	`weekly` if the weekly points ran out, `monthly` if the monthly ones did.

Field	What it says
`details.used` and `details.remaining`	The points used and the points left in that limit.
`details.resets_at`	When the points come back, in ISO 8601.
`details.fallback_to_credits`	`false` if the switch is off.
`details.credits`	The AI credits the account has.
`Retry-After`	The seconds to wait before trying again.

Do not mix it up with rate_limited

`rate_limited` is also a 429, but it means you went over the key's requests per minute. It passes in seconds, and tools usually retry by themselves. `plan_limit_reached` only passes at the weekly or monthly reset. Always read the `code`.

What to do

1. Wait for the `resets_at` date.
2. Turn on "Use credits when the plan runs out" in the **Plan tab** and have credits in your balance.
3. Buy credits, if the switch is already on and the balance has run out.
4. Move to a bigger plan with **Change plan**, if it happens often.

In the tools and in your own programs

In Claude Code, the error comes in the Anthropic format, with the `type` `rate_limit_error` and the same message. In Codex CLI it comes in the OpenAI format, with the same `code`. In a program of your own, do not retry in a loop: wait the seconds in `Retry-After` or show the `resets_at` date to the user.
